ABSTRACT

Most children know how to describe an object--by color, size, and shape. Here they'll learn that all objects are made of matter and that all matter can be described with basic scientific properties--mass, weight, volume and density. Each of these properties is described using fun, real-life examples. With clear illustrations and hands-on activities, students will gain a basic understanding of the properties of matter. This 23-minute videotape correlates to the National Science Education Standards for Physical Science: properties of objects and materials, position and motion of objects, and light, heat, electricity, and magnetism. The program includes a teacher's guide. (MM)
